

Executive Sales Performance Dashboard

Compare actual sales against targets, understand margins and evaluate customers and salespeople.

BUSINESS BRIEF | CLIENT REQUIREMENTS | DATA MODEL | STEP-BY-STEP BUILD

What the project does

Compare actual sales against targets, understand margins and evaluate customers and salespeople. It turns the specified source tables into an interactive, filterable view of these business outcomes.

Synthetic demo checkpoints

Reference figures below describe the included synthetic dataset only; they are not client results.

REFERENCE KPI	DEMO VALUE
Revenue	PKR 152,095,000
Gross Profit	PKR 40,848,467.67
Revenue Target	PKR 98,550,000
Target Attainment	154.3%
Sales Transactions	PKR 1,267

REQUIREMENTS NOTE | This guide translates the repository specification into an implementation brief. Confirm it with the actual client; it is not a signed discovery or acceptance document.

01 / Business problem and client requirements

Agree the outcome and KPI definitions before loading customer data.

Business problem

Compare actual sales against targets, understand margins and evaluate customers and salespeople.

Without consistent definitions, business totals can be difficult to compare or trace back to a responsible team, customer, product, or period. The dashboard is designed to let managers review the specified KPIs, apply business filters, and inspect supporting detail. This is the intended use inferred from the project specification, not a claim about a named client's current process.

Requirements interpreted from the project specification

- Provide a Power BI report that supports the stated goal: Compare actual sales against targets, understand margins and evaluate customers and salespeople.
- Show the 3 project pages, their KPI cards, charts, filters, and detail tables listed in the page blueprint.
- Calculate the named measures using their documented formulas and preserve the project rules.
- Use the reporting scope: 01 Oct 2025-30 Sep 2026 transactions; daily account targets.
- Allow analysis by: Accounts.Region, Accounts.Salesperson, Calendar.Month
- Deliver editable PBIP report and semantic-model source, a data contract, private-source templates, and a reconciliation path.

Project boundaries

SalesID is unique; Units > 0. Targets have exactly one row per account/date. Revenue is net of discounts, before tax. Customer attributes describe current ownership, not historical salesperson assignment.

Client discovery questions

Confirm source systems and data owners; reporting currency and timezone; period and as-of date; refresh frequency; exact business definitions; privacy and access requirements; who signs off; and whether publishing to Power BI Service is in scope.

02 / Data contract and model

Keep the input tables at their documented grain; the grain determines what a summed KPI means.

TABLE	GRAIN / KEY	FIELDS (SOURCE TYPE)
Accounts	one customer account / AccountID	AccountID (string), Customer (string), Region (string), Segment (string), Salesperson (string)
Sales	one sales transaction / SalesID	SalesID (string), AccountID (string), Date (dateTime), Units (int64), Revenue (decimal), Cost (decimal)
Targets	one account per day / TargetID	TargetID (string), AccountID (string), Date (dateTime), TargetRevenue (decimal)
Metrics	one metadata row / Label	Label (string)
Calendar	one calendar date / Date	Date (dateTime), Year (int64), Month (string), Quarter (string)

Relationships in the PBIP model

FROM (MANY)	TO (ONE)	FILTERING
Sales.AccountID	Accounts.AccountID	oneDirection
Targets.AccountID	Accounts.AccountID	oneDirection
Sales.Date	Calendar.Date	oneDirection
Targets.Date	Calendar.Date	oneDirection

Data handoff: Use data/import-template with exact filenames and headers. Keep client source files in approved private storage; do not commit them. Set DataMode=Folder and DataFolder to the approved location only after validating the inputs.

03 / KPI and DAX glossary

Treat these formulas and definitions as a signed calculation contract.

MEASURE	DAX SPECIFICATION	MEANING
Revenue	SUM(Sales[Revenue])	Sum of Revenue at the recorded grain.
Cost of Sales	SUM(Sales[Cost])	Sum of Cost at the recorded grain.
Gross Profit	[Revenue] - [Cost of Sales]	Revenue less cost of sales.
Gross Margin	DIVIDE([Gross Profit], [Revenue])	Gross profit / revenue.
Units Sold	SUM(Sales[Units])	Sum of Units at the recorded grain.
Revenue Target	SUM(Targets[TargetRevenue])	Daily account targets; date and account filters affect actual and target.
Target Attainment	DIVIDE([Revenue], [Revenue Target])	Revenue divided by target.
Target Variance	[Revenue] - [Revenue Target]	Positive means ahead of target.
Sales Transactions	COUNTROWS(Sales)	Number of sales transactions.
Active Customers	DISTINCTCOUNT(Sales[AccountID])	Customers with a sale in the selected period.
Average Transaction	DIVIDE([Revenue], [Sales Transactions])	Revenue per sales transaction.
Revenue YTD	TOTALYTD([Revenue], 'Calendar'[Date])	Calendar-year revenue through the last selected date; select a populated period.
Previous Month Revenue	CALCULATE([Revenue], DATEADD('Calendar'[Date], -1, MONTH))	Revenue in the date selection shifted back one month. Use a single month for month-over-month comparison.
Month Growth	DIVIDE([Revenue] - [Previous Month Revenue], [Previous Month Revenue])	Revenue growth versus selected dates shifted back one month; blank if prior revenue is absent.

Format currency using the client's approved reporting currency. Show rate, margin, attainment, and share measures as percentages. Format units, hours, days, and counts as whole or decimal numbers only where their source supports it.

04 / Build step by step | 1-5

Work through the stages in order and preserve the original demo as your baseline.

1. Confirm the business decisions

Start with: Compare actual sales against targets, understand margins and evaluate customers and salespeople. Confirm who will use the report and what action each page supports. Agree the reporting period, currency, refresh cadence, data owner, KPI definitions, cutoffs, and acceptance owner. The brief here is inferred from this repository spec, not a signed client requirements document.

2. Request the right source extracts

Request the tables at this grain: Accounts: one customer account, key AccountID; Sales: one sales transaction, key SalesID; Targets: one account per day, key TargetID. Use the exact file names, headers, primary keys, and types listed in the data dictionary. Ask for historical periods only where the project scope supports them; do not assume snapshots can reproduce history.

3. Keep data secure and test its quality

Place client files in approved private storage, outside GitHub. Check unique keys, required fields, valid dates, numeric signs, foreign keys, and coverage. Preserve these rules: SalesID is unique; Units > 0. Targets have exactly one row per account/date. Revenue is net of discounts, before tax. Customer attributes describe current ownership, not historical salesperson assignment. The demo is synthetic and is for testing the model, not for client reporting.

4. Open the PBIP source project

Download and extract the full repository, then open power-bi/02-executive-sales/Dashboard.pbip in Power BI Desktop. Keep the complete folder structure. PBIP saves report and semantic-model definitions as project files that can be versioned [1].

5. Check the known-good demo baseline

Refresh in Demo mode. Review DATA-CONTRACT.md, validation/expected-demo.json, and Model.SemanticModel/DAXQueries/Reconcile.dax. Record the supplied demo totals and click through every page before replacing the source.

05 / Build step by step | 6-10

Connect private data, build the model, and test the finished report.

6. Connect the client's approved data

Copy the matching CSV templates from `power-bi/02-executive-sales/data/import-template/` to the client's private source folder. In Power Query > Manage Parameters set `DataMode` to `Folder` and `DataFolder` to that absolute path. Keep the required Metrics row. Select Transform Data to inspect types and fix errors before loading [2].

7. Prepare fields and relationships

Use the declared data types, retain one row at the required grain, and handle blanks only as documented. Check these many-to-one links in the model: `Sales.AccountID > Accounts.AccountID`; `Targets.AccountID > Accounts.AccountID`; `Sales.Date > Calendar.Date`; `Targets.Date > Calendar.Date`. Lookup tables should filter facts; avoid fact-to-fact joins that multiply values [3].

8. Add and reconcile measures

Use `measures.dax` and the KPI glossary as the calculation contract. Create explicit DAX measures with approved formats. Test results under each date and business-unit filter; verify totals against an independent calculation. Measures respond to the report filter context [4].

9. Build and review the report pages

Recreate the report blueprint below: exact page purpose, slicers, KPI cards, chart series, and detail rows. Add clear titles, sort time labels chronologically, format currency and percentages, and test interactions. Keep project-specific definitions visible to the report user.

10. Sign off, publish, and hand over

Refresh, reconcile source totals, test edge cases, document KPI ownership, and obtain business sign-off. Keep the PBIP source in version control. If service publishing is in scope, publish to the approved workspace, configure credentials and gateway if needed, schedule refresh, and test permissions [5]. Do not publish confidential data before access/security sign-off.

06 / Report blueprint and acceptance

Implement each page to support a specific decision and trace each number to source data.

PAGE / FILTERS	KPI CARDS	CHARTS / DETAIL TABLE
Revenue and targets Filters: Month, Region, Salesperson	Revenue, Gross Profit, Target Attainment, Target Variance	Charts: Revenue by Region; Revenue by Month Detail: Salesperson, Revenue, Revenue Target, Target Variance, Gross Margin
Customers and margins Filters: Month, Region, Salesperson	Active Customers, Sales Transactions, Average Transaction, Gross Margin	Charts: Gross Profit by Segment; Revenue by Customer Detail: Customer, Revenue, Cost of Sales, Gross Profit, Gross Margin
Sales team performance Filters: Month, Region, Salesperson	Units Sold, Revenue, Gross Profit, Target Attainment	Charts: Revenue by Salesperson; Gross Profit by Month Detail: Salesperson, Active Customers, Units Sold, Revenue, Target Attainment

Acceptance checklist

- Open the PBIP in current Power BI Desktop and refresh all tables without errors.
- Reconcile source counts, key uniqueness, relationships, and every project-specific data rule.
- Compare KPI measures to independently calculated totals and the supplied expected-demo.json.
- Test each slicer, filter interaction, date behavior, chart title, table detail, blank context, and zero denominator.
- Confirm currency, percentage formats, report audiences, privacy, access, refresh ownership, and client sign-off.

Demo acceptance values

METRIC	EXPECTED (SYNTHETIC)
Revenue	PKR 152,095,000
Gross Profit	PKR 40,848,467.67
Revenue Target	PKR 98,550,000
Target Attainment	154.3%
Sales Transactions	PKR 1,267
Active Customers	30

07 / Handover and references

Use the Microsoft guidance below for product workflows; verify tenant-specific settings at delivery.

- Document approved data owner, source, refresh schedule, and support contact.
- Keep the metric dictionary, data contract, sign-off totals, and known limits with the delivered report.
- For Service deployment, confirm target workspace, credentials, gateway needs, permissions, tenant policies, and applicable license.
- A slicer does not enforce row-level security. Design and test security separately before exposing restricted data.
- This repository contains synthetic examples and a source implementation. Desktop rendering, engine evaluation, Service deployment, and client acceptance are separate release gates.
